## Background

$\gamma\delta$  T-cells represent a first line of defense against pathogens in the mucosa. Despite their prevalence in gut associated lymphoid tissue (GALT), little is known about their role in HIV infection. We hypothesize that  $\gamma\delta$  T-cells are stimulated by viral antigen and demonstrate anti-HIV activity, comprising a critical component of the mucosal response to HIV.

## Methods

To assess the role of  $\gamma\delta$  T-cells, we analyzed peripheral blood and GALT samples from HIV(-) and HIV(+) patients, including elite controllers.  $\gamma\delta$  T-cells were isolated and assessed in viral inhibition and CD4+ killing assays. The cellular pathway associated with cell killing was also evaluated. An HIV antigen screen was used to stimulate sorted  $\gamma\delta$  T-cells. Nanostring analysis was used to measure mRNA. High-throughput TCR sequencing was performed in peripheral and mucosal tissue.

## Results

The mucosal subtype, V $\delta$ 1, exists at higher percentages in HIV(+) peripheral blood, particularly elite controllers (17.1 $\pm$ 4.0), relative to HIV(-) subjects (0.3 $\pm$ 0.2) ( $p=0.0001$ ). A 100-fold increase of the V $\delta$ 1 subtype was detected in the ileum of HIV controllers. V $\delta$ 1 cells in the GALT of HIV(-) patients, unlike those in the periphery, directly kill up to 80% $\pm$ 20% of HIV+CD4+ T-cells in culture and inhibiting virus production by 3 logs. These antiviral effects are expanded to the periphery in the setting of elite control.  $\gamma\delta$  T-cell mediated killing is correlated to perforin expression ( $R=0.8088$ ). Nef-specific responses in V $\delta$ 1 cells were observed in patients with lower viral loads and higher CD4+ count indicating that antiviral effects may be mediated by an HIV-specific response ( $p=0.01$ ).

## Conclusion

$\gamma\delta$  T-cells play a key role in the response to HIV infection. HIV specific  $\gamma\delta$  T-cells are expanded from mucosal tissue to the periphery where they exert anti-viral effects. Further study may suggest ways to harness this unique subset to stimulate both innate and acquired immunity in response to HIV.
